## V. LÍNEAS DE INVESTIGACIÓN

The main activity of my research group is focussed on the field of theory and modelling of electronic and structural properties in condensed matter and on developing novel theoretical tools and computational codes to investigate the electronic response of solids and nanostructures to external electromagnetic fields. Present research activities are: new developments within many-body theory and TDDFT, including ab-initio description of electron excitations, optical spectroscopy, time-resolved spectroscopies, STM/STS, XAFS and lifetimes, novel techniques to calculate total energies and assessment and development of exchange-correlation functionals for TDDFT calculations; improvements on transport theory within the real-time TDDFT formalism; characterization of the electronic and optical properties of solids, nanostructures (in particular nanotubes, nanowires and semiconducting clusters) and biomolecules. The main research interest at present spans six main lines:

- Fundamental aspects of Time-Dependent Density Functional Theory and Many-Body Perturbation Theory
- Foundations of Time-dependent Density Functional Theory
- Foundations of Many-Body Theory
- Extended systems: solids, liquids, Applications (e. g. photovoltaics)
- Theory of Open quantum systems. Strong light-matter interactions and Optimal control Theory
- Theoretical Spectroscopy: photoemission, time-resolved optical and magnetic spectroscopies, Raman, IR ...
- Biotechnology and hybrid materials: photovoltaic applications
- Nanostructures and nanotubes. Nanocapilarity. Nanoplasmonics
- Electronic and Thermal transport
- Code development

The research is supported at present by different European Research Networks and projects and by the Spanish and Basque research agencies.
